Database Systems

# **Lecture 9**

# **Enhanced Entity**

# **Relationship**

# **Modelling**

# E-R Modeling Capabilities

Entity Relationship Models are normally adequate for building data models of traditional, administrative based database systems such as

- Stock control

- Product ordering

- Customer invoicing.

# Evolution of Databases

Designers of database applications have tried to design more accurate database schemas that reflect the data properties and constraints more precisely.

This was particularly important for newer applications of database technology, such as databases for

- Engineering design and manufacturing
- Telecommunications
- Complex software systems
- Geographic information systems (GISs)

# Enhanced Entity-Relationship Modeling

Enhanced Entity-Relationship (EER) modeling is an extension of ER modeling to include object-oriented concepts such as:

- superclasses and subclasses
- specialization and generalization
- aggregation and composition

# Superclasses & Subclasses

A **superclass** is a general class that is extended by one or more subclasses.

A **subclass** is a more specific class that extends a superclass by inheriting its methods and attributes and then adding its own methods and attributes.

**Inheritance** is the process of a subclass inheriting all the methods and attributes of a superclass.

# Subclasses

Entity type has numerous subgroupings or subtypes of its entities that are meaningful and need to be represented explicitly because of their significance to the database application

EMPLOYEE entity type may be distinguished further into

- Secretary, Engineer, Technician
- Manager, Director
- Salaried employee, Hourly employee

UML class diagram:

Triangle points to superclass

# When to Use EER Modeling?

It is important to emphasize that many database projects do not need the object-oriented modeling features of EER modeling.

Remember the goal of conceptual modeling is to produce a model that is simple and easy to understand.

Do not introduce complicated subclass/superclass relationships if they are not needed.

Only use the EER modeling constructs if they offer a significant advantage over regular ER modeling

# Example Employee Relation

| <u>eno</u> | ename     | bdate    | title | salary | supereno | dno  |
|------------|-----------|----------|-------|--------|----------|------|
| E1         | J. Doe    | 01-05-75 | EE    | 30000  | E2       | null |
| E2         | M. Smith  | 06-04-66 | SA    | 50000  | E5       | D3   |
| E3         | A. Lee    | 07-05-66 | ME    | 40000  | E7       | D2   |
| E4         | J. Miller | 09-01-50 | PR    | 20000  | E6       | D3   |
| E5         | B. Casey  | 12-25-71 | SA    | 50000  | E8       | D3   |
| E6         | L. Chu    | 11-30-65 | EE    | 30000  | E7       | D2   |
| E7         | R. Davis  | 09-08-77 | ME    | 40000  | E8       | D1   |
| E8         | J. Jones  | 10-11-72 | SA    | 50000  | null     | D1   |

**title** attribute indicates what job the employee does at the company.  
Consider if each job title had its own unique information that we would want to record such as:

programming language used (lang), DB used (db)

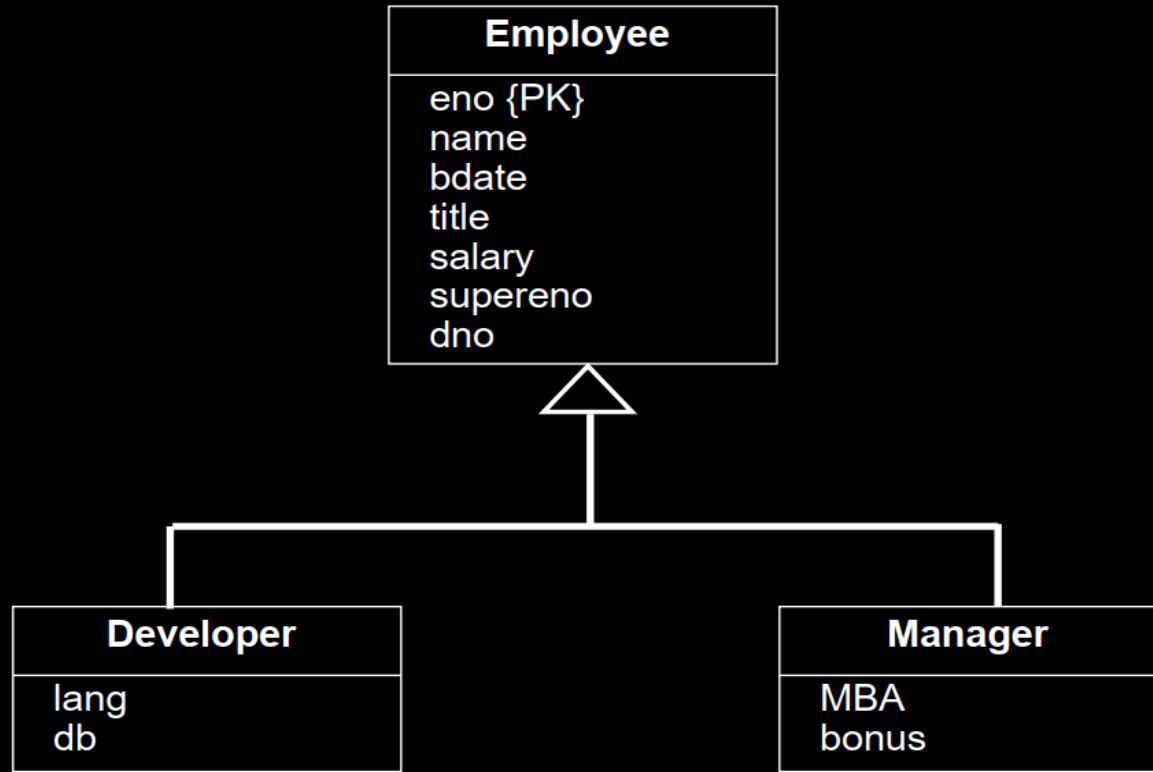

# Example Employee Relation

We could represent all these attributes in a single relation:

| <u>eno</u> | ename     | bdate    | title | salary | supereno | dno | lang | db     | MBA | bonus |
|------------|-----------|----------|-------|--------|----------|-----|------|--------|-----|-------|
| E1         | J. Doe    | 01-05-75 | EE    | 30000  | E2       |     | C++  | MySQL  |     |       |
| E2         | M. Smith  | 06-04-66 | SA    | 50000  | E5       | D3  |      |        | N   | 2000  |
| E3         | A. Lee    | 07-05-66 | ME    | 40000  | E7       | D2  |      |        | N   | 3000  |
| E4         | J. Miller | 09-01-50 | PR    | 20000  | E6       | D3  | Java | Oracle |     |       |
| E5         | B. Casey  | 12-25-71 | SA    | 50000  | E8       | D3  |      |        | Y   | 4000  |
| E6         | L. Chu    | 11-30-65 | EE    | 30000  | E7       | D2  | C++  | DB2    |     |       |
| E7         | R. Davis  | 09-08-77 | ME    | 40000  | E8       | D1  |      |        | N   | 3000  |
| E8         | J. Jones  | 10-11-72 | SA    | 50000  |          | D1  |      |        | Y   | 6000  |

Note the wasted space as attributes that do not apply to a particular subclass are NULL

# Example Employee Relation

A better solution would be to make two subclasses of *Employee* called *Developer* and *Manager*

# Example Employee Relation

Employee Relation

| <u>eno</u> | ename     | bdate    | title | salary | supereno | dno  |
|------------|-----------|----------|-------|--------|----------|------|
| E1         | J. Doe    | 01-05-75 | EE    | 30000  | E2       | null |
| E2         | M. Smith  | 06-04-66 | SA    | 50000  | E5       | D3   |
| E3         | A. Lee    | 07-05-66 | ME    | 40000  | E7       | D2   |
| E4         | J. Miller | 09-01-50 | PR    | 20000  | E6       | D3   |
| E5         | B. Casey  | 12-25-71 | SA    | 50000  | E8       | D3   |
| E6         | L. Chu    | 11-30-65 | EE    | 30000  | E7       | D2   |
| E7         | R. Davis  | 09-08-77 | ME    | 40000  | E8       | D1   |
| E8         | J. Jones  | 10-11-72 | SA    | 50000  | null     | D1   |

Manager Relation

| <u>eno</u> | lang | db     |
|------------|------|--------|
| E1         | C++  | MySQL  |
| E4         | Java | Oracle |
| E6         | C++  | DB2    |

Developer Relation

| <u>eno</u> | MBA | bonus |
|------------|-----|-------|
| E2         | N   | 2000  |
| E3         | N   | 3000  |
| E5         | Y   | 4000  |
| E7         | N   | 3000  |
| E8         | Y   | 6000  |

# Generalization & Specialization

Subclasses and superclasses are created by using either generalization or specialization.

**Specialization** is the process of creating more specialized subclasses of an existing superclass.

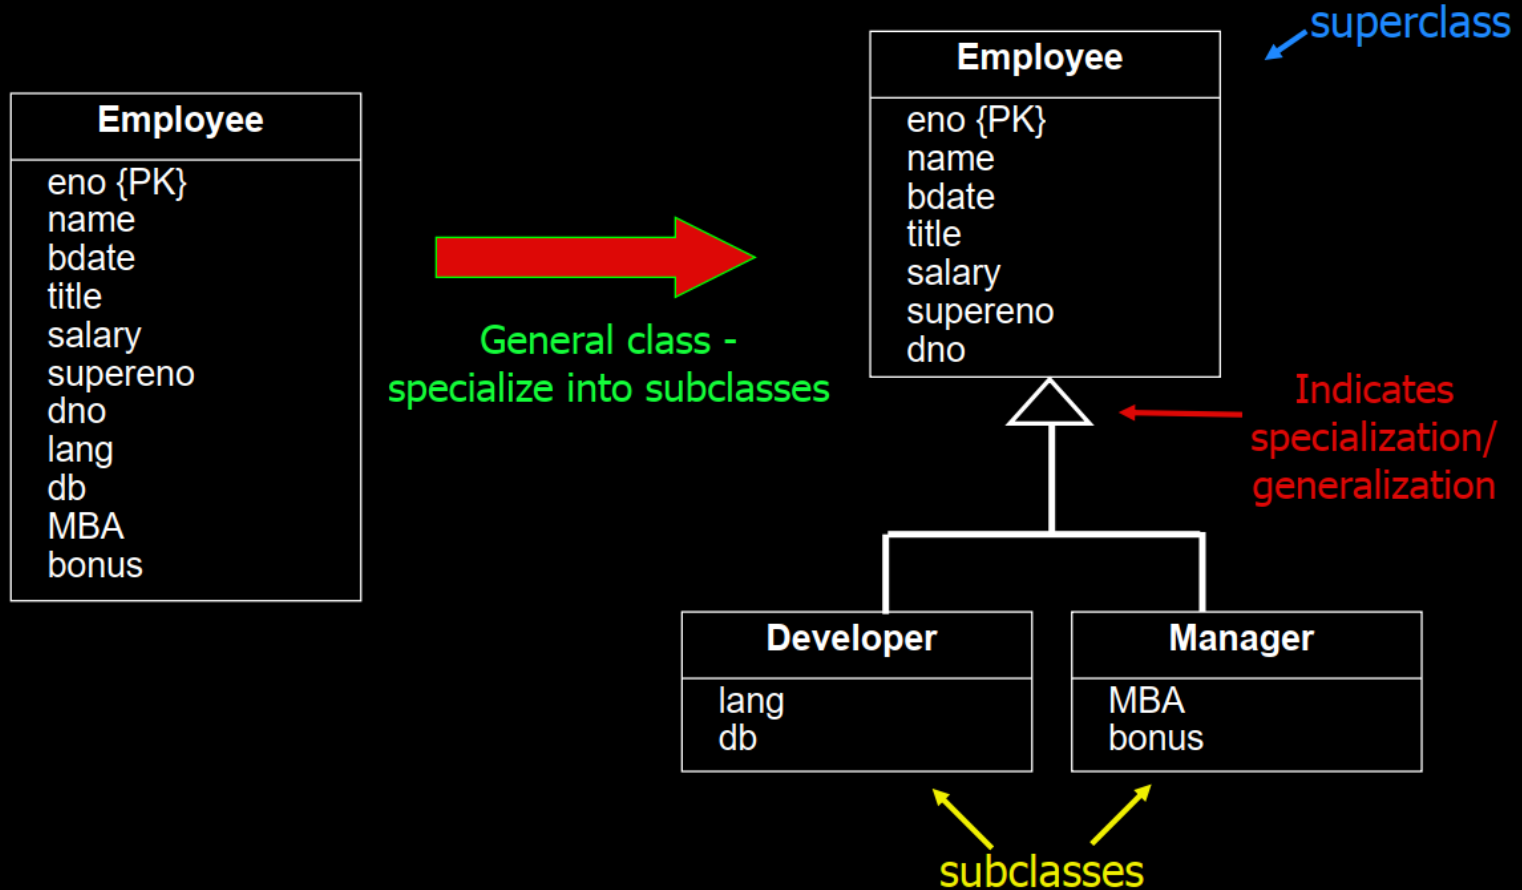

- ◆ **Top-down process:** Start with a general class and then subdivide it into more specialized classes.

- ⇒ The specialized classes may contain their own attributes. Attributes common to all subclasses remain in the superclass.

**Generalization** is the process of creating a more general superclass from existing subclasses.

- ◆ **Bottom-up process:** Start with specialized classes and try to determine a general class that contains the attributes common to all of them.

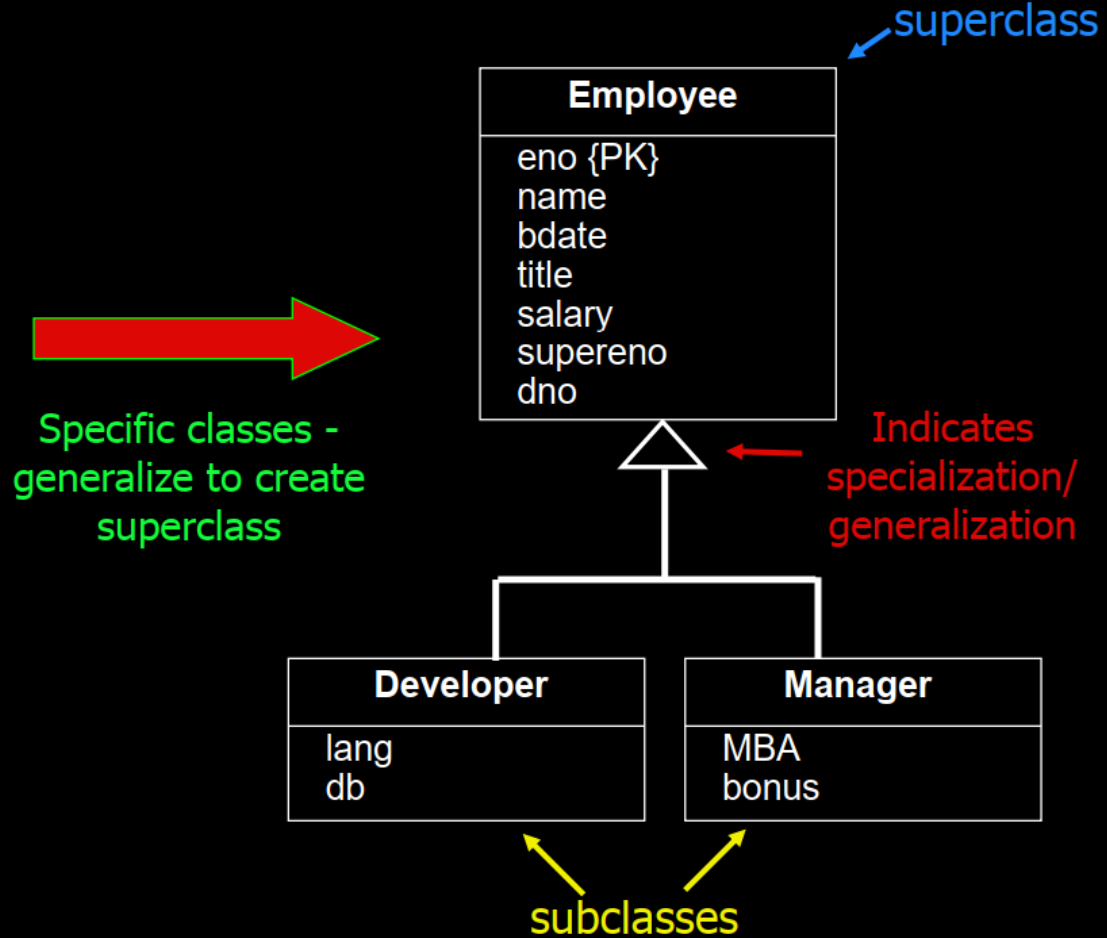

# Specialization

# Generalization

| Developer     |
|---------------|
| number {PK}   |
| developerName |
| birthDate     |
| title         |
| salary        |
| supereno      |
| dno           |
| lang          |
| db            |

| Manager   |
|-----------|
| eno {PK}  |
| name      |
| birthDate |
| title     |
| salary    |
| supereno  |
| dno       |
| MBA       |
| bonus     |

# Constraints on Generalization & Specialization

There are two types of constraints associated with generalization and specialization:

◆ **Participation constraint** - determines if every member in a superclass must participate as a member of one of its subclasses.

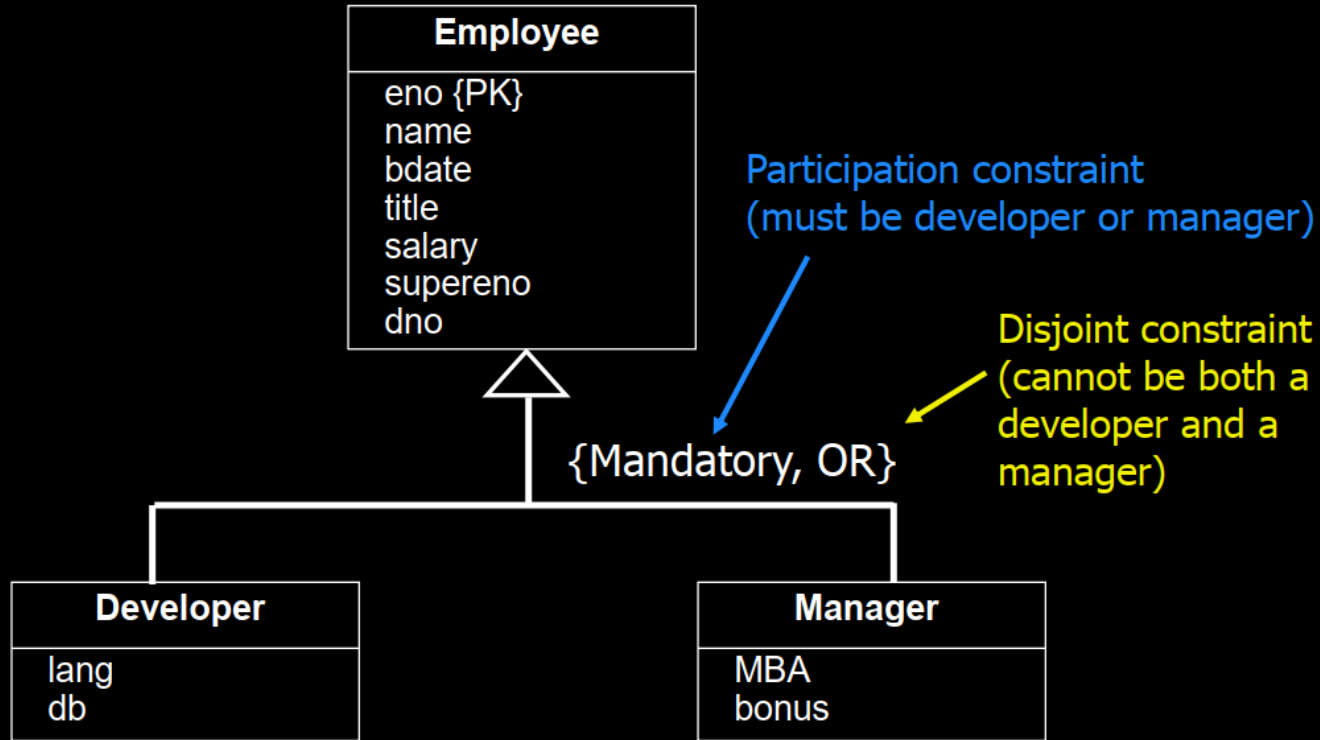

⇒ It may be *optional* for a superclass member to be a member of one of its subclasses, or it may be *mandatory* that a superclass member be a member of one of its subclasses.

◆ **Disjoint constraint** - determines if a member of a superclass can be a member of one or more than one of its subclasses.

⇒ If a superclass object may be a member of only one of its subclasses this is denoted by *OR* (subclasses are *disjoint*).

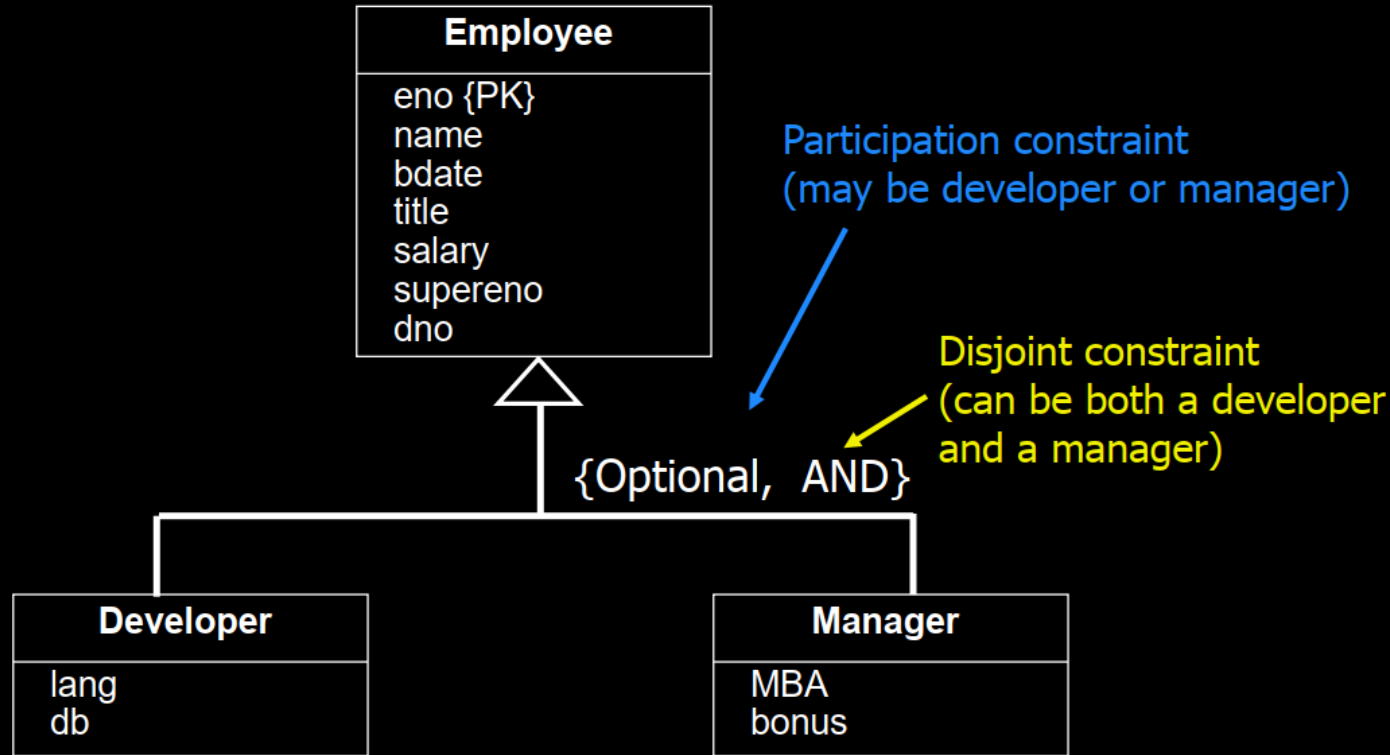

⇒ Otherwise, *AND* is used to indicate that it may be in more than one of its subclasses.

# Constraints Example

An employee must be either a **developer** or a **manager**,  
but *cannot be both*.

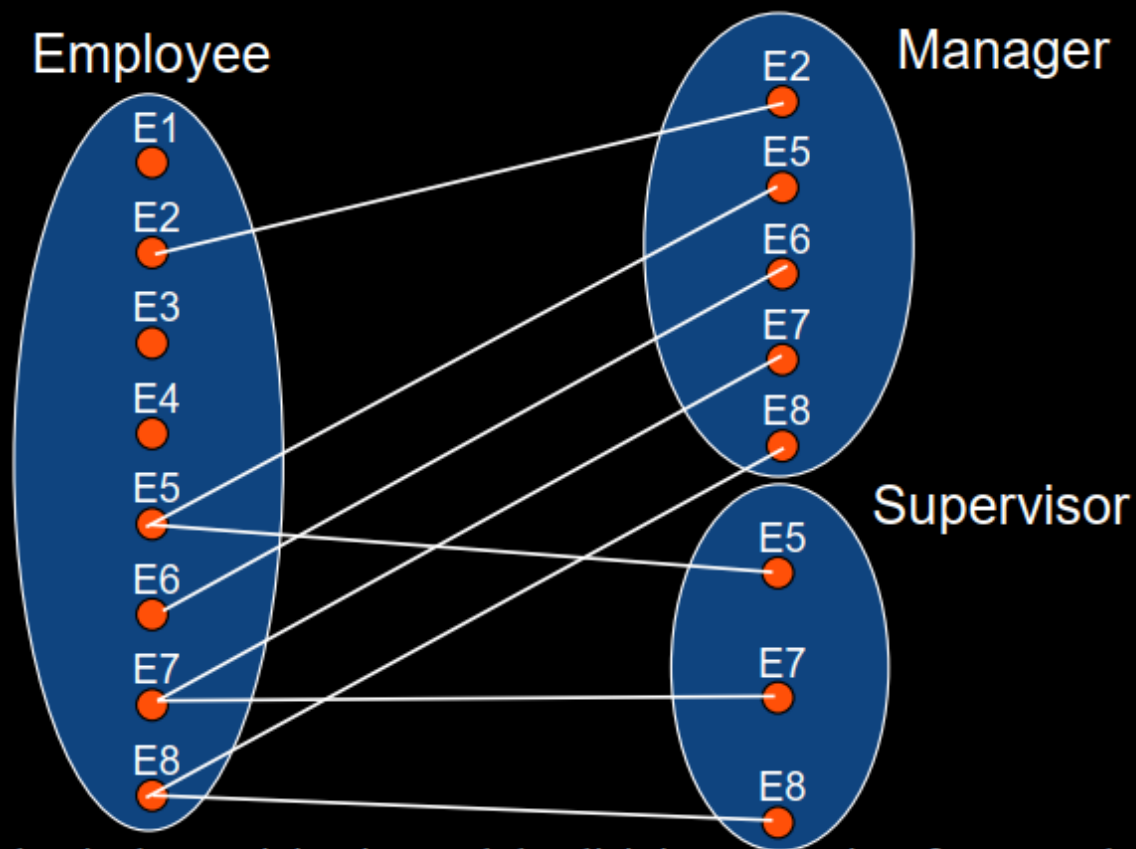

# Constraints Example

---

An employee may specialize as a developer or manager.  
An employee may be both a manager and developer.

# Time to Think !!!

Note: What is the participation and the disjoint constraints for superclass `Employee` (with subclasses `Manager` and `Supervisor`) given these instances?

# Relationship Constraints

- ◆ Minimum # of occurrences – called participation constraint in both cases
- ◆ Maximum # of occurrences – called cardinality constraint for relationships and disjoint constraint for subclasses

# Combining Inheritance Constraints & Relationship Constraints

Possible combinations:

## Subclass Constraints

Optional, AND

Optional, OR

Mandatory, AND

Mandatory, OR

## Relationship Constraints

0..\*

0..1

1..\*

1..1

# More on Generalization & Specialization

**Predicate-defined constraints** specify when an object participates in a subclass using a certain rule.

- ◆ For example, a subclass called `RichEmployees` can be defined with a membership predicate such as `salary > 100000`.

**Attribute-defined subclasses** are a particular type of predicate-defined constraint where the value of an attribute(s) determines if an object is a member of a subclass.

- ◆ For example, the `title` field could be used as a *defining attribute* for the `Developer` and `Manager` subclasses.

⇒ `Emp is in Developer if title = 'EE' or 'PR'`

⇒ `Emp is in Manager if title = 'ME' or 'SA'`

# Multiple Inheritance

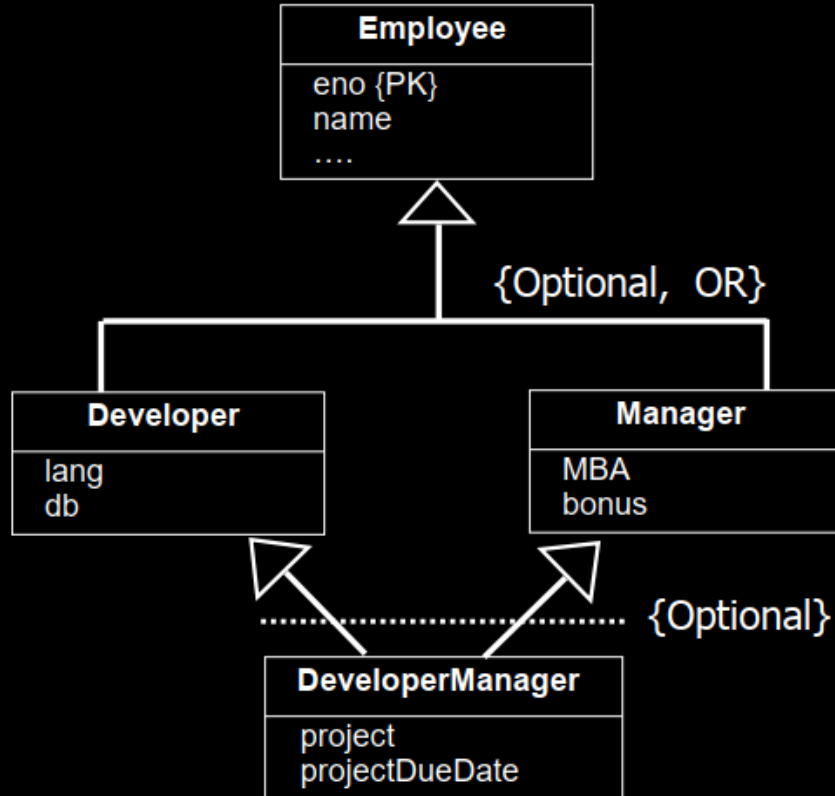

If each class only has one superclass, then the class diagram is said to be a **specialization** or **type hierarchy**.

If a class may have more than one superclass, then the class diagram is said to be a **specialization** or **type lattice**.

Although multiple inheritance is powerful, it should be avoided if possible.

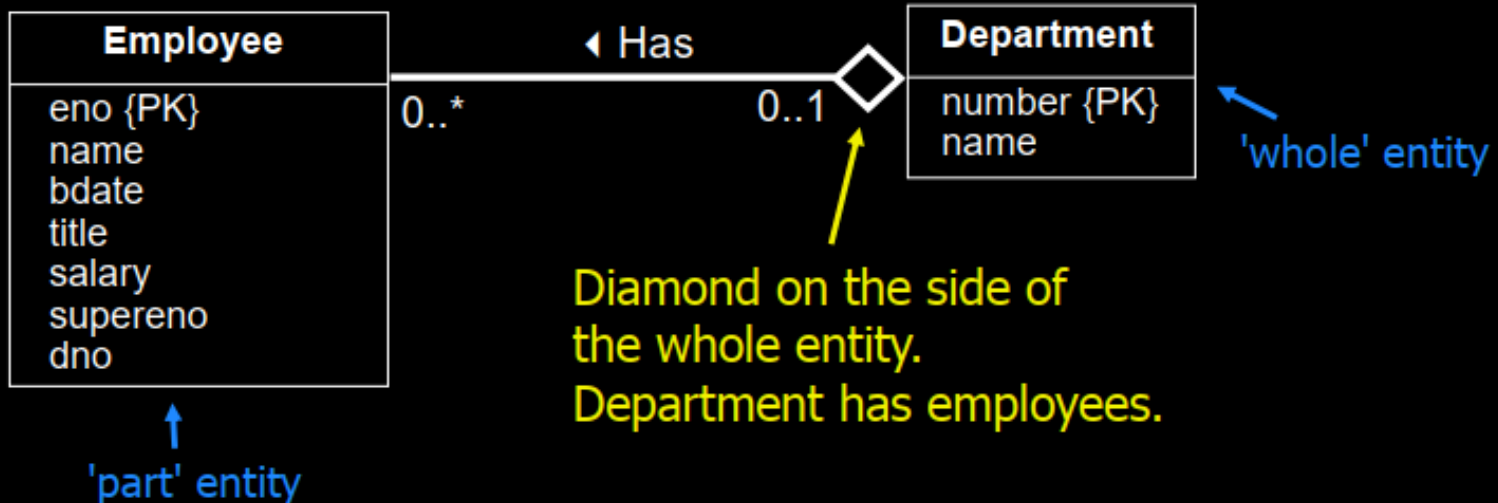

# Multiple Inheritance

# Aggregation

**Aggregation** represents a 'HAS-A' or 'IS-PART-OF' relationship between entity types. One entity type is the *whole*, the other is the *part*.

Example:

# Aggregation

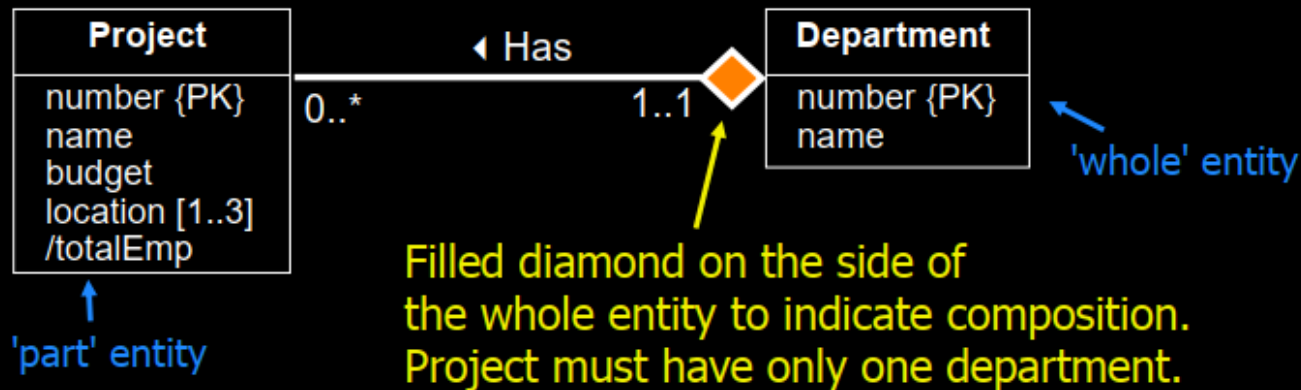

- part object can simultaneously belong to multiple composite objects
- maximum multiplicity at the composite side is undetermined
- part object can also occur without belonging to a composite object
- loose coupling

# Composition

**Composition** is a stronger form of aggregation where the part cannot exist without its containing whole entity type and the part can only be part of one entity type.

Example:

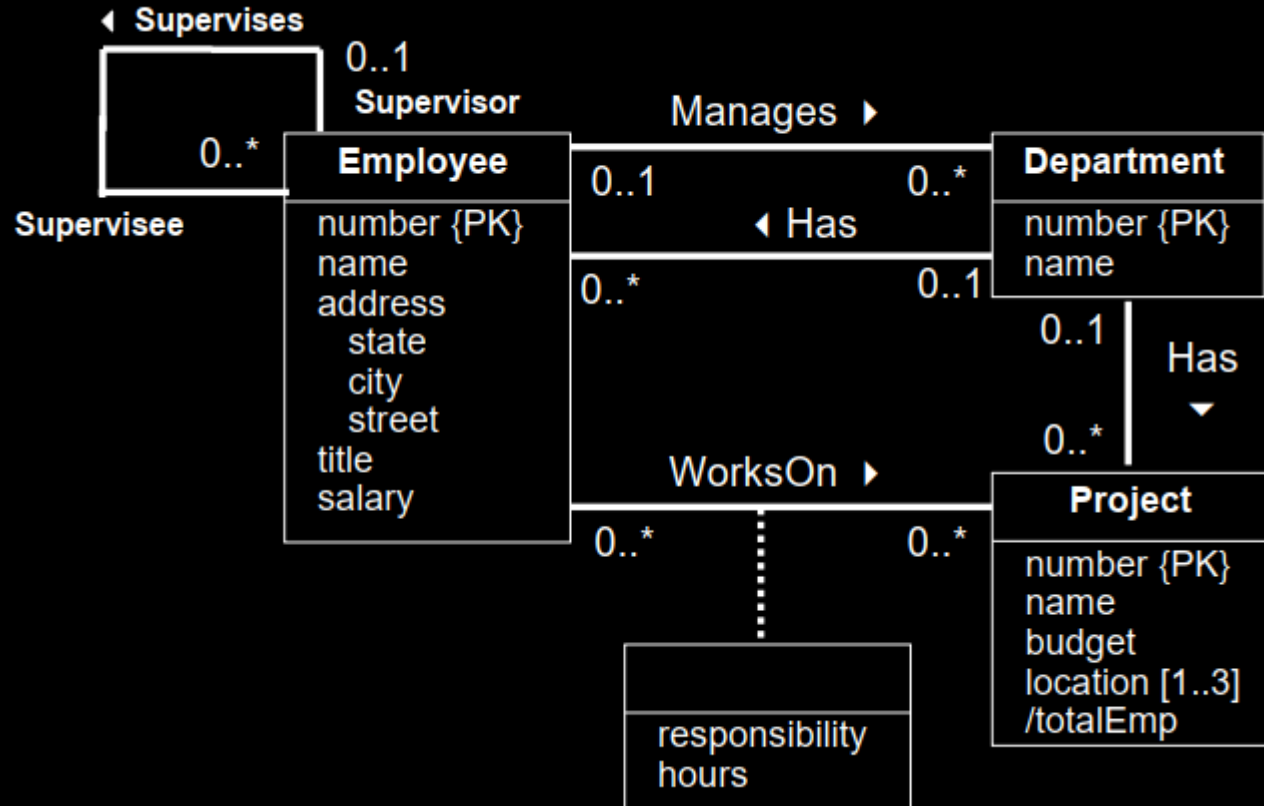

# Composition

- the part object can only belong to one composite
- maximum multiplicity at the composite side is 1
- minimum multiplicity can be either 1 or 0
- tight coupling

# ER Model - Example

# EER Model - Example
